CAD to Revit

Structural CAD drawings to a Revit model: checked, not redrawn

A guide for the team: what the app does, how to sign in, and how to take a job from drawings to model.

Runs in your browser | Nothing to install | Your own projects | Never guesses a size

WHAT IT IS

The app reads the structural drawings and builds the model for you

You give it a job's DWG or DXF drawings. It finds the columns, beams, slabs and walls, reads their marks and sizes, and builds the model in Revit, IFC or Rhino. You check the result.

1

Reads any consultant's drawings

Plans, schedules, details and sections. Each value is matched to the mark it belongs to, whatever the layer names or label style.

2

Shows where every value came from

Click any beam, column or slab to see its size and the drawing it came from. Where the drawings disagree, or say nothing, the app marks it for you to decide.

3

Builds the model

Download a Revit file, an IFC file, a Rhino file, or a package for whoever builds the model. Your decisions go into it.

The one rule: the app never guesses. A size that is not clear in the drawings is shown for you to decide. It is never filled in quietly.

THE WHOLE JOB IN FOUR STEPS

The four steps across the top of the app

Click a step to go to it. A step you can't use yet tells you what to do first.

1 · Import CAD

Upload every structural drawing of the job.

2 · Analyse

Tick the floors, name them as in Revit, press Analyse.

3 · Review

Look over the plan and 3D. Decide anything in red or yellow.

4 · Export

Download the Revit, IFC or Rhino file, or a package.

The project name at the top left (click **change**) takes you back to the start page and your list of projects.

GETTING IN

Open the app in your browser

The app runs on one office PC, and you use it from your own PC through Chrome or Edge. Nothing is installed or copied to your PC.

`http://DESKTOP-1B6U4I7:8770/`

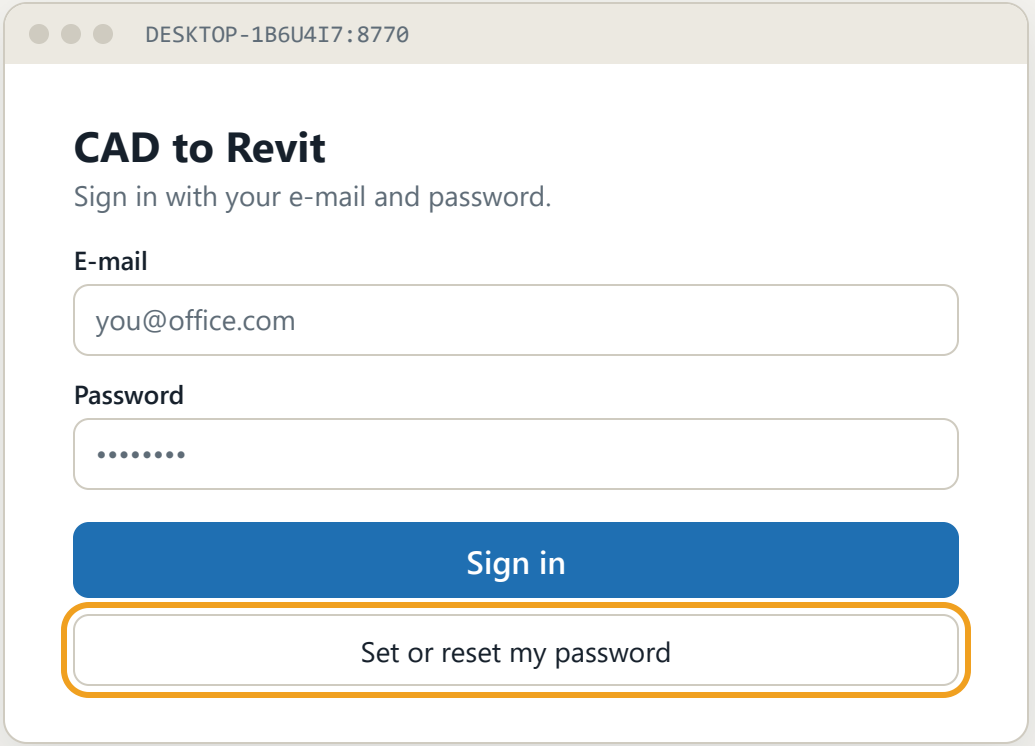

If that link does not open, try **`http://192.168.1.36:8770/`**

- You need to be on the **office network**, at the office.
- **Bookmark** the page so you can open it again easily.
- It only opens while the app is running. If neither link works, it is switched off, so let us know.
- Sign in with your **office e-mail address**, the one you were given access with.
- The first time, you choose your own password (next slide).
- Your projects are your own. Other team members don't see them.

FIRST TIME ONLY

Set your password

1. Open the app link. Type your **e-mail** and leave the password empty.
2. Press **Set or reset my password**.
3. An e-mail *"Set your CAD to Revit password"* arrives. Check **Spam** if you don't see it.
4. Open its link within **30 minutes**. Each link works only once.
5. Type a password of **at least 8 characters** twice, then press **Save password**.
6. Press **Sign in now** and sign in with your e-mail and the new password.

SIGNING IN

Every day after that: e-mail, password, Sign in

Your browser keeps you signed in until you press **Sign out** (top right), or after 30 days without using the app.
Always sign out on a shared PC.

IF THE SIGN-IN PAGE SAYS…	WHAT TO DO
No password is set for this e-mail yet.	Press **Set or reset my password** and follow the e-mail (slide 5).
The e-mail or password is not right.	Check for typing mistakes and Caps Lock. Use the full e-mail address.
Too many wrong passwords. Try again in … minutes.	After 5 wrong tries sign-in pauses for 15 minutes. Wait, or reset your password.
This e-mail is not approved to use CAD to Revit yet.	Your access is still being set up. You'll get an e-mail when you can sign in.
Your access ended on …	Let us know and it will be renewed.
This link is out of date or was already used.	Ask for a new link with **Set or reset my password**.

THE START PAGE

Start a job, or carry on with one

This is the first page after you sign in. Make one project per job (or per building in a job). It keeps the drawings, your decisions and the results together.

New project

Type the job's name, for example *Hotel Main Block*, then press Create. It is saved with your other projects.

Try a sample

A small made-up drawing set, for trying the app out before a real job. A good first thing to do.

Your recent projects

Listed under the tiles. Click one to carry on where you left off. Your decisions are already in it.

Tip: new drawing revision for the same job? Open the project, go to **Import CAD** and press Start a new drawing set. Nothing is deleted. The earlier results and your decisions are kept.

STEP 1

Import CAD: upload the drawings

Add every structural drawing of the job: DWG or DXF, from any consultant.

1. Press **Add drawings...** to pick files, or **Add a whole folder...**
2. Wait for *"Uploading 3 of 8 ..."* to finish. Each drawing then appears in the list.
3. Added one by mistake? Press the **×** beside it.
4. Press **Continue to Analyse →**

Add more than the plans

Schedules, beam and column details and sections are where many sizes are written. The more of the set you add, the fewer values you'll have to fill in yourself.

Only DWG and DXF files are taken. Anything else in a folder is skipped.

STEP 2

Analyse: tell it the floors, then let it read

The app ticks the floors it finds in the drawing names. Check them, then analyse.

1. **Floors:** tick every floor the building has. Use **Ground up to** to tick a range at once.
2. **Names:** pick each floor's Revit name, or use `Level 0, 1, 2 …` / `Ground, First, Second …`
3. **Heights:** type each level's height in mm from the drawings' ±0, or type one floor-to-floor height and press `Fill heights`.
4. Press `Analyse drawings`.

While it works

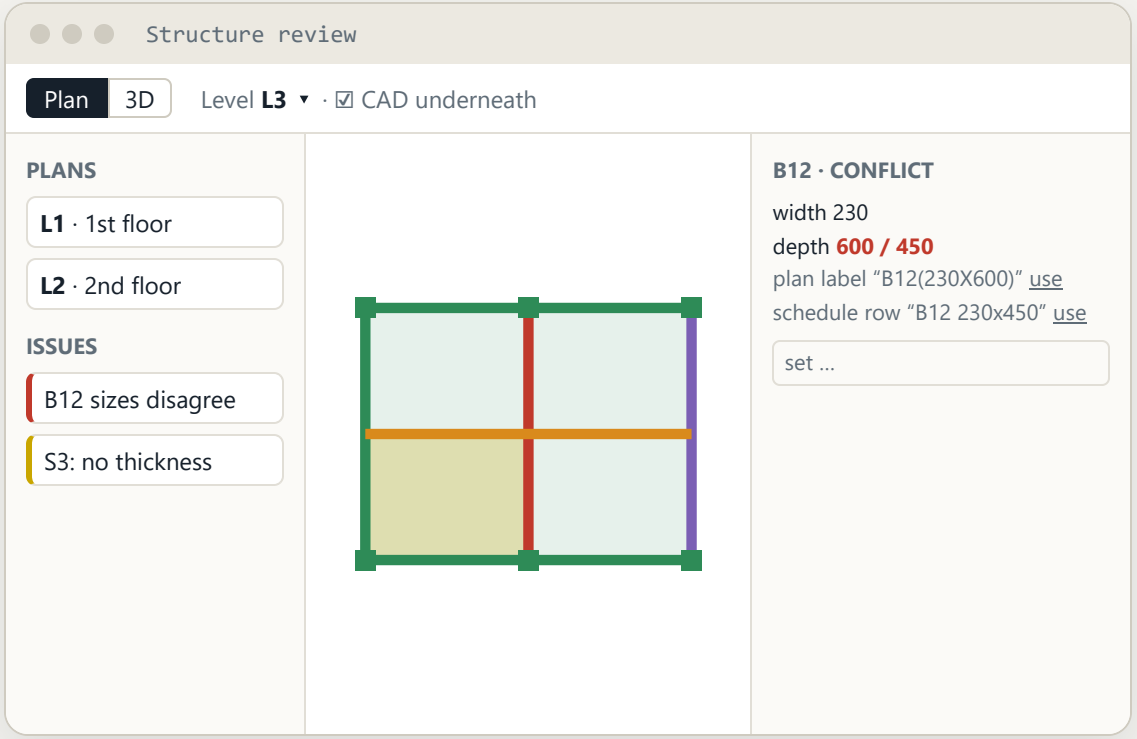

A bar shows each stage: *Preparing → Reading drawings → Linking and checking → Writing the review → Writing Revit files → Done*. A full set takes a few minutes. **Show details** has the full log.

New consultant?

Tick *"Let the app work out what unfamiliar layers hold"*. You will check what it found in Review.

STEP 3

Review: the plan, coloured by how sure the app is

- **Green**: read, and the sources agree
- **Red**: the drawings disagree. You decide.
- **Yellow**: missing. No drawing gives this value.
- **Orange**: read with low confidence. Worth a look.
- **Purple**: decided by you
- **Grey**: left out of the model

- **Plan / 3D** at the top. **Level** picks the floor.
- **CAD underneath** shows the drawing's own lines. Orange dashed outlines were drawn but are not in the model, so check them.
- Scroll to zoom, drag to move, hover for the mark and size.

STEP 3 · MAKING DECISIONS

Click an element, check its sources, decide

The panel on the right lists each value (width, depth, thickness, mark …) with every drawing it was read from.

1. Click a beam, column or slab, or an item in the **Issues** list on the left.
2. Press `use` beside the source you trust, *or* type the value in the **set** box and press **Save typed values**.
3. **Apply to:** *this element only*, or *every B12 on level 3*. One decision fixes them all.
4. Not a real element? **Exclude from model**. Changed your mind? **Undo decisions here**.
5. When you're done, press **Done - Export →**

Saved as you go

Every decision is saved in your project immediately (*"saved in the project automatically"*). Closing the browser loses nothing. The next analysis of the same project keeps your decisions.

Sizes are in millimetres

Type numbers only, e.g. **600**, not 600mm. The app refuses a size that isn't a number above 0.

Unfamiliar marks

mark prefix in Issues: the app read a consultant's own marks (e.g. SL1) from their schedules. Confirm with `beam` `slab` …, then press Analyse again. **did you mean**: a mark written two ways (S01 / S1). It is never matched by itself.

STEP 4

Export: check, then download your model

Press **Export to Revit**. The **Before you build** panel then shows what goes to the model and what is still waiting for you.

- **Needs a decision:** not built until you decide it in Review. You can also tick *"Build these anyway at a working size"*: they are built in red, with the reason in their Comments.
- **Not built by the app yet:** model these by hand for now.
- **Floor levels:** fill in any missing heights, then **Save and update the Revit files**.

.rvt Revit file

Create Revit file, then **Download**. The model is built into a new Revit project.

.ifc IFC file

The same model in the open BIM format. Revit: File › Open › IFC.

.3dm Rhino file

A layer for each level and type. Anything still undecided is red.

.zip Revit package

Revit files, review page and summary, for whoever builds the model.

Also, at the bottom of the page: **Review workbook (Excel)** lists every element and value · **3D view in its own tab** · **Summary** lists what needs a decision, in order.

KNOW WHAT TO EXPECT

What goes into the model

Built by the app

- Columns: position, size and rotation, floor by floor
- Beams: straight and curved, at their marked sizes
- Slabs: with cut-outs, thickness and sunk areas
- Walls and lift cores
- Levels at the heights you gave

Check, or do by hand

- Anything on the **Not built by the app yet** list on the Export page
- Anything left red or yellow in Review: not built, or built red if you chose so
- Reinforcement: listed in the Excel workbook, never modelled
- Always compare the model with the drawings before you issue it

Remember: the app speeds up modelling. It does not replace your check. If something looks wrong, it is usually something the drawing doesn't say clearly. Review will show you where.

GOOD HABITS

Tips for a smooth job

- **One project per job** (or per building). Name it clearly.
- **Add the whole set**, not just the plans. Schedules and details fill in the sizes.
- **Work through the Issues list** top to bottom. It is quicker than hunting on the plan.
- **Decide by mark** (*every B12 on level 3*) when the same answer fits them all.
- **New revision?** Use `Start a new drawing set` in the same project. Your decisions carry over.
- **Press Analyse again** after changing floors or adding drawings, then export again.
- **Use the Help button** (top right) for a quick reminder of the four steps.
- **Sign out** when you're done on a shared PC.

NEED HELP?

Found something wrong, or stuck?

Write it in the team issues sheet, so every issue is in one place and nothing gets lost.

Open the CAD to Revit issues sheet

1. Open the sheet with the green button above.
2. Make **your own tab**: press **+** at the bottom left, then double-click the new tab and rename it to **your name**.
3. Write **one issue per row** on your tab, with the details on the right.
4. Add new issues to the same tab each time.

What to write in each row

Date

Project: its name, and the drawing or floor

Element: its mark, e.g. B47

The issue: what you see, and what you expected

Screenshot: of the Review plan or model, with the place circled
